

Transcript App - One-Page Summary

What it is

Next.js app for searching Escape Hatch podcast transcripts and episode metadata. It answers questions with sourced passages and episode details.

Who it's for

Podcast hosts, producers, or reviewers who need quick recall of past episodes.

What it does

- Streams answers and progress updates during search.
- Classifies queries (factual/interpretive/hybrid) to pick data sources.
- Searches transcript chunks with OpenAI embeddings and vector similarity.
- Filters episode metadata (season, episode, release date, guest, reviewer, notable fields).
- Shows transcript sources with speakers, timestamps, and relevance scores.
- Supports audio uploads and AssemblyAI transcription via API routes.

How it works

- UI (src/app/page.tsx) sends query to /api/search/stream (SSE).
- Server classifies query with Anthropic and loads metadata (data/episode-metadata.json).
- Transcript search loads vector-store.json, generates OpenAI embedding, ranks chunks.
- Answer is synthesized with Anthropic Claude and streamed to the client.
- Ingestion script (scripts/ingest.ts) chunks transcripts and builds vector-store.json.
- Transcription pipeline uses Vercel Blob + AssemblyAI webhook routes.

How to run

- 1) npm install
- 2) npm run dev
- 3) Set required API keys in .env.local (OpenAI/Anthropic/AssemblyAI, etc.).
Env file/example Not found in repo.
